

BOD MEETING

1/25/2020

9:00 AM

Manager's Report

Comp/Vac/Sick

- BH- 39 Sick/ 12 Vac
- JJ- 0
- TS-0

Snowpack

- 113 percent of normal
- 86 percent of last year at this time.

Current Fish Production

- **2020 TRIPLOID RAINBOWS:** This class of fish is 26 months old. We currently have 12,506 and they are roughly 1.5 lbs. This year class of fish is infected with gill lice at an extreme level. MML will be conducting a study with researchers from Colorado Parks and Wildlife to help mitigate the infection.
- **2021 TRIPLOID RAINBOWS:** This class of fish is currently 14 months old. We have 25,163 fish that are 10" long.
- **2022 TRIPLOID RAINBOWS:** We currently have 30403 fish that are approximately 1.25 inches long. These fish are growing very well. We have switched these fish to a freeze dried brine shrimp diet that has helped their growth tremendously. This diet is also a much cleaner feed than the trout starter that we used to feed.
- **2019 CUTTHROAT TROUT:** We currently have 3110 fish. These fish are doing very well and are 3.0" long. These fish are ready to be stocked as soon as the ice comes off the lakes
- **CUTBOWS:** We currently have 3170 cutbows in pond 2. These are extra fish for MML. These fish will either be used as regular catchables or possibly for the 2021 supercatchable program. We will monitor their growth closely and make the decision next summer.
- **BROWNS:** Currently we have approximately 2000 brown trout. These fish are roughly 1 inch long and just recently began feeding. These fish are on a high protein freeze dried brine shrimp diet. We will raise these fish until next summer before stocking.

- **TIGER TROUT:** Currently we have approximately 300 tiger trout. These fish are roughly 1 inch long. These fish have also recently began feed on a freeze dried brine shrimp diet. We will raise these fish until next summer before stocking.

Stocking Report 2019

- We have concluded the catchable rainbow stocking for the 2019 season. This season we stocked 7685 fish @ a 2.69 lb average, (20687 total pounds). 43 ounce average. Biggest in MML history.
- All supercatchables were stocked in October. Through the winter sampling, all supercatchables appear to be very healthy and have maintained excellent body condition. These fish averaged roughly 4 pounds when stocked. 779 fish were stocked.

Gill Lice Research

- CPW Researchers looking to develop a plan for MML to help with the gill lice infection. Still waiting on more info. Will keep the board up to speed on what is happening.

Upcoming Look at 2020 Stocking

- We expect a stocking year similar to 2020. Gill lice might have a big effect on when we stock and what size they might be.

Upcoming Meetings

- CAA Annual Meeting- Jan 31, 2020/ Mt. Princeton
- AFS Annual Meeting- Feb 25-27, 2020/ Laramie, WY
- Jordan will get his chemical applicator license this spring from the department of Ag

Guest Permit Revenue for 2019

- 2019- \$45280. \$2720 short. Most likely because of bad weather in May and an early closing in October.

CC Data

- Still working on the data from 2019
- Find what information is relevant to adjust stocking
- CPMH vs. quality
- What are the club stocking goals. (Numbers/Size/Ect)

Fish Management Plan-

- Make a fish management plan for all lakes based on real data. Gillnets, winter sampling, stocking data, fish condition, CC.
- Make a page that shows data for each lake and the management strategy. Make it easy to understand.

Water Summarization

- Need to summarize our water for the entire spring, summer, and fall. One date (Aug 25th) isn't a reflection for the entire water season.

This winter so far

- CC Data
- Winter samples
- Making new work schedule
- Fish management plans
- Ice management- Been a cold winter so far
- Maintenance- Pumps, vehicles, hatchery and shop supplies
- Daily chores
- Keeping the fish thinned and healthy- Only 39 gpm. Running hatchery at max capacity without using the pump.
- Plowing
- Cleaning out office and unneeded files. Going through computer to see what is relevant and what isn't.
